TITLE: Non-negative additive functionals of Markov processes

PERIODICAL: Akademii nauk SSSR. Doklady, v. 137, no. 1, 1961, 17 - 20

TEXT: The notations are the same as in the papers by Ye.B. Dynkin (Ref.1 : UMN, 15, no. 2, 3 (1960) ; Ref. 2 : Osnovaniya teorii markovskikh protsessov [Foundations of the Theory of Markov processes], 1959). Let $X = (x_t, \xi, \mathcal{M}_t, P_x, \theta_t)$ be a homogeneous Markov process. A non-negative additive homogeneous functional of X means the function $\varphi_t^s(\omega)$ of the elementary event ω and $0 \leq s \leq t \leq \infty$ which satisfies the following conditions :

A. φ_t^s is ω -measurable with respect to the σ -algebra generated by the events $\{x_n \in \Gamma\}$, $0 \leq u \leq t$. There exists a set N with a P_x -measure 0 so that for $\omega \notin N$ the following conditions are satisfied :

B. $\varphi_t^s + \varphi_t^u = \varphi_t^{s+u}$

Card 1/ 5

20311

3/020/61/137/001/001/021
C111/C222

Non-negative additive functionals ...

C. $\varphi_{t+h}^{s+h} = \theta_h \varphi_t^s$

D. $0 \leq \varphi_t^s \leq \infty$

E. φ_t^s is continuous from the right side with respect to t.If φ_t^s is continuous from the right side with respect to s too then

$$f(x) = M_x \varphi_\infty^0$$

is an excessive function, i.e. $f(x) \geq 0$, $T_t f(x) \equiv M_x f(x_t) \leq f(x)$, (1)T_t f(x) → f(x) (t → 0). (1) is called a representation by a generalized potential. The excessive function f(x) is called purely excessive if T_t f(x) → 0 (t → ∞). The author considers only Markov standard processes (cf. (Ref. 4 : V.A. Volkonskiy, Tr. Mosk. matem. obshch. 9, 143(1960))).

Theorem 1 : Let the process X be so that every bounded purely excessive function is representable by a generalized potential, where the corresponding functional is given by

Card 2/5

20311

Non-negative additive functionals ...

S/020/61/137/001/001/021
C111/C222

$$\varphi_t^s = \lim_{h \rightarrow 0} \int_s^t \frac{f(x_u) - T_h f(x_u)}{h} du . \quad (2)$$

Then for the fact that a finite excessive function f is representable by a generalized potential it is necessary and sufficient that

$$M_x f(x_{\tau\{f>n\}}) \rightarrow 0 \quad (n \rightarrow \infty) \quad (3)$$

holds for all x . Here $\tau\{f>n\}$ is the moment of the first reach of the set $\{x : f(x) > n\}$; the function below the sign of the mathematical expectation equals zero if the process does not reach this set.

The theorems 2 and 3 are defined for three-dimensional Wiener processes.
Theorem 2 : In order that an excessive function $f(x) \geq \infty$ given by

$$f(x) = \int \frac{1}{|x-y|} \mu(dy) \quad (4)$$

where $|x-y|$ is the distance between x and y , μ -- measure in the

Card 3/5

20311

Non-negative additive functionals ...

S/020/61/137/001/001/021
C111/C222

three-dimensional space, is representable by a generalized potential it is necessary and sufficient that the measure μ equals zero for every set of the capacity zero. It is also sufficient that only $\int f = \infty$. \rightarrow

Theorem 3 : There exists a one - to - one relation between finite functionals of the three-dimensional Wiener process for which $\varphi_{\infty}^s = \lim_{t \rightarrow \infty} \varphi_t^s$, and such measures μ in the three-dimensional space that there exists an increasing sequence of closed sets F_n which fills the whole space and for which $\int_{F_n} \frac{1}{|x-y|} \mu(dy) < C_n < \infty$, and that with the probability 1 there exists an n so that $x_t \in F_n$ ($0 \leq t < \infty$). The connection between functional and measure is as follows: for every non-negative Borel function $g(y)$ it holds

Card 4/5

20311

Non-negative additive functionals ...

S/020/61/137/001/001/02!
C111/C222

$$M_x \int_0^\infty g(x_n) \varphi(du) = \int \frac{g(y)}{|x - y|} \mu(dy) .$$

Functionals φ_t^s being finite for $s, t \in [0, \infty)$, $(0, \infty]$, $(0, \infty)$ with the probability 1 are also in a one-to-one relation with corresponding classes of measures.

The author mentions V.A. Volkonskiy.

TITLE: On Lateral Conditions for Multi-Dimensional Diffusion Processes

PERIODICAL: Teoriya veroyatnostey i yeye primeneniya, 1959, Vol 4, Nr 2,
pp 172~185 (USSR)

ABSTRACT: Let K be a closed bounded domain in the n -dimensional Euclidean space. Let the boundary Γ of K be sufficiently smooth. Let C be the Banach space of functions continuous on K with the norm $\|f\| = \max_{x \in K} |f(x)|$; let \mathcal{L} be an elliptic differential operator

of second order in K . The author seeks the most general lateral conditions which restrict \mathcal{L} to an infinitesimal operator of a timely homogeneous Markov process in K satisfying the condition of Feller. Processes the infinitesimal operators of which are restrictions of the closure of an elliptic operator are called diffusion processes. The author solves the given problem for the case that K is a circle or a sphere and the process invariant with respect to the rotation. In the general case the author obtains partial results. 5 theorems and 5 lemmas are given. There are 8 references, 4 of which are Soviet, 3 American, and 1 Japanese.

TITLE: Axisymmetric contact problem on the connection between a circular cylindrical shell and an elastic plate

SOURCE: Samoletostroyeniye i tekhnika vozduzhnogo flota, no. 6, 1966, 72-77

TOPIC TAGS: mechanics, stress analysis, contact stress, shell theory, cylindric shell structure, ELASTIC PLATE

ABSTRACT: The author considers the axisymmetric problem of joints between circular cylindrical shells and thin elastic plates in the elastic stage. A general equation is given for bending of the shell under the effect of an arbitrary axisymmetric load and for uniformly distributed and varying loads. Expressions are derived for determining displacement of the contact line of the shell and the plate and an example is given showing application of the method to a circular cylindrical shell with a hinged support connected to a thin elastic plate. It is found that the shell is relieved by the thin elastic plate which takes on part of the load applied to the shell. Orig. art. has: 3 figures, 1 table, 23 formulas.

TITLE: Ornamental Finishing of Aluminum (Dekorativnaya otdelka
alyuminiya)

PERIODICAL: Tr. Leningr. tekhnol. in-ta im. Lensoveta, 1957, Nr 43,
pp 38-42

ABSTRACT: A method for ornamental finishing of Al by means of its electrochemical oxidation followed by adsorption coloring of the oxide film is described. The operations of the industrial process of coloring Al golden are examined. The importance of conducting the chemical and electrochemical polishing of the metal before the oxidation and the correct selection of the coloring agents is emphasized. The compositions of solutions for the chemical and electrochemical polishing, the working conditions, and the comparative characteristics of the operation are adduced. Mixtures of alizarin red and mordant true yellow is recommended for the coloring. Depending upon the ratio of their concentrations in the solution it is possible to tint the oxide films the color of pure gold and of its alloys with Cu and Ag. R.S.

TITLE: How the Stability of a Composite Bar Assembly Is Affected by the Mode of Constraint Employed (Vliyanije usloviy zakrepleniya na ustoychivost' sterzhnevykh naborov)

PERIODICAL: V sb.: Issledovaniya po voprosu ustoychivosti i prochnosti. Kiyev, AN UkrSSR, 1956, pp 113-122

ABSTRACT: The author uses the method of finite differences to solve the problem of the stability of a composite bar assembly comprised of two systems of rectilinear, mutually perpendicular, bars; each bar in each system is elastically constrained at both ends, each end of each bar being fastened to a fixed support; the two sets of supports for each bar system are discretely spaced in rectangular patterns. The dimensions and elastic properties of all the bars in each system are identical, such that when buckling occurs through the action of two systems of compressive forces the junction points may undergo displacement only in a direction that is perpendicular to the original plane of the assembly, i. e., to the plane that it occupied before buckling. Graphs are included to facilitate calculation.

TITLE: On the general solution, in polar coordinates, of
the problem of plate bending

PERIODICAL: Prykiadnaya mekhanika, v. 7, no. 5, 1961, 521 - 529

TEXT: In solving, by the method of initial functions, concrete
problems of bending of sectorial circular plates, the calculations
can be considerably simplified by taking as the initial line, one
of the radial boundaries of the plate. The general solution of
this problem is considered. The dimensionless radial coordinate

$$\xi = \frac{1}{\lambda} \ln \frac{r}{r_1}, \quad \lambda = \ln \frac{r_2}{r_1} \quad (1)$$

is introduced; the bending is denoted by w , the angle of rotation
of the normal - by θ , the bending moments - by M , the torsion mo-

On the general solution, in ...

ments - by $M_{r\theta}$, the reduced transverse stresses - by V , and the reaction - by R . The radial boundary $\theta = 0$ is taken as the initial line. The complete system of equations which describe the bending, is written in polar coordinates. Further, the canonical equations of the method of initial functions are set up. In this system,

$$L_{sj} = L_{sj}(\alpha, \theta) \quad \begin{cases} s = w, \theta_r, \dot{\theta}, M_r, M, V_r, V, R; \\ j = w, \theta, M, V \end{cases} \quad (11)$$

are operators which have to be determined. For that purpose, three groups of equations are set up. It is found that these operators ought to satisfy conditions:

$$L_{sj}(\alpha, 0) = \begin{cases} 1, & \text{if } j = s \\ 0, & \text{if } j \neq s \end{cases} \quad (17)$$

($s, j = w, \theta, M, V$). The expressions for the operators are found in the form of eight formulas

On the general solution, in ...

$$L_{RV} = -\frac{1}{4\lambda} [\cos \eta \alpha - \cos \eta (\alpha - 2\lambda)]. \quad (25)$$

The obtained equations yield the sought-for general solution of the problem. If the plate contour can be described by sufficiently smooth functions, concrete problems can be solved by a method proposed by V.A. Ahar'ov in an earlier article. For hinged radial edges of the plate, this method yields

$$w_0 = 0; M_0 = 0;$$

$$\theta_0 = -L_{wV}(\theta_0, a) \varphi(\xi); V_0 = L_{w\theta}(\theta_0, a) \varphi(\xi) - \frac{1}{L_{wV}(\theta_0, a)} w_p(\xi, \theta_0); \quad (27)$$

$$\sqrt{\frac{\sin \eta_0 \alpha}{\alpha}} \frac{\sin \eta_0 (\alpha - 2\lambda)}{\alpha - 2\lambda} \varphi(\xi) = \frac{1}{\lambda^2} \left[\frac{L_{MV}(\theta_0, a)}{L_{wV}(\theta_0, a)} w_p(\xi, \theta_0) - M_{\theta p}(\xi, \theta_0) \right] \quad (28)$$

and for rigidly clamped edges:

$$w_0 = 0; \theta_0 = 0;$$

$$M_0 = L_{wV}(\theta_0, a) \varphi(\xi); V_0 = -L_{wM}(\theta_0, a) \varphi(\xi) - \frac{1}{L_{wV}(\theta_0, a)} w_p(\xi, \theta_0); \quad (29)$$

Card 8/10

On the general solution, in ...

S/198/61/007/005/008/015

$$[\alpha(\alpha - 2\lambda) - \lambda^2 \cos 2\eta_0 \lambda - (\alpha^2 - 2\lambda\alpha - \lambda^2) \cos 2\eta_0(\alpha - \lambda)] \frac{1}{a(a - 2\lambda)} \psi(\xi) \quad (29)$$

$$= 8\lambda^2 \left[\frac{L_M(\theta_0, a)}{L_{m1}(\theta_0, a)} w_p(\xi, \theta_0) - v_p(\xi, \theta_0) \right]. \quad (30)$$

A particular solution for w_p is found

$$w_p(\xi, \theta) = -\frac{r_1^3 \lambda^2}{4} \int_0^\xi d\tau \int_{\xi - i\frac{\theta - \tau}{\lambda}}^{\xi + i\frac{\theta - \tau}{\lambda}} e^{2\lambda\xi} d\xi' \int_0^\tau d\tau' \int_{\tau - i\frac{\theta - \tau'}{\lambda}}^{\tau + i\frac{\theta - \tau'}{\lambda}} e^{2\lambda\xi'} p(\xi', \tau') d\xi'. \quad (38)$$

Further, several questions related to the use of the method of initial functions, are considered. It is noted that the transcendental operators (18) - (25) are interpreted as a shortened form of differential operators of infinite order. Such an interpretation

Card 9/10

On the general solution, in ...

S/198/61/007/005/008/015
D274/D303

imposes considerable restrictions on the initial functions: their unlimited differentiability is required. In certain cases it is possible to use the apparatus of generalized functions or to express the operators L in the form of integral- or functional operators. There are 3 figures and 7 Soviet-bloc references.

$$R(\xi, \eta) = -2(1-\mu) \frac{D}{a} (L_{Rw} W_0 + L_{R\theta} \theta_0 + L_{RM} M_0 + L_{RV} V_0). \quad (3)$$

where

$$W_0 = W_0(\eta) = \frac{1}{a} w(0, \eta), \quad \theta_0 = \theta_0(\eta) = \theta_v(0, \eta), \quad (4)$$

$$M_0 = M_0(\eta) = -\frac{a}{D} M_v(0, \eta), \quad V_0 = V_0(\eta) = -\frac{a^2}{D} V_v(0, \eta)$$

Substitution in (1) gives a system of general differential equations for functional operators. Integration and the initial conditions

$$L_{sj} \Big|_{\xi=0} = \begin{cases} 1, & \text{if } s = j \\ 0, & \text{if } s \neq j \end{cases} \quad s, j = w, \theta, M, V$$

and substitution gives a series of equations which, together with
Card 4/5

Applying the method of initial ...

26756
S/021/60/000/011/004/009
D204/D302

(3) give the general solution of (1) with arbitrary conditions on the edge of the rectangular plate. The boundary conditions on the initial line give two relationships between W_0 , t_0 , M_0 and V_0 , so that (3) are now dependent on two unknown initial functions. The boundary conditions on the edge of the plate parallel to the initial line gives a system of two homogeneous equations in these functions which give rise to one transcendental solvable equation, in terms of a function $\varphi(\eta)$. The method gives a sufficient number of arbitrary parameters for the exact or approximate satisfaction of the boundary conditions. The cases of symmetric, quasisymmetric and non-symmetric oscillations are worked out in detail. There are 6 figures and 4 Soviet-bloc references.

TITLE: Calculation of thermal reactors with plutonium reuse

SOURCE: Atomnaya energiya, v. 16, no. 5, 1964, 413-417

TOPIC TAGS: thermal reactor, plutonium reuse, natural uranium reactor, depleted uranium reactor, calculation

ABSTRACT: This article considers the steady state operation of a natural or depleted uranium reactor with partial return of the resultant plutonium into the fuel cycle. It also determines the optimum values for avoiding resonance absorption in U²³⁸, the optimum moderator and fuel ratio, and the portion of plutonium to be returned into the fuel cycle. The dependence of the neutron multiplication coefficient on the above parameters is investigated and it is indicated that available indicated that water cooled moderated reactors or boiling water reactors can be operated with natural uranium (or its UO₂) and with partial addition of formed plutonium. No U²³⁵ enrichment facility is required. Extensive calculations

Card

1/2

ACCESSION NR: AP4036524

indicate that a burnout of 10 Mwd/ton can be reached. Upon return of plutonium into the cycle, burnout can be raised considerably in natural uranium reactors with graphite or heavy water moderators. Here, even depleted uranium can be used. The method is also applicable to the uranium-thorium cycle. "Gratitude is expressed to Prof. Dr. Shteynbek for outlining the work and discussing it, and to Dr. Fuks for his valuable suggestions." Orig. art. has: 1 figure, 21 formulas, no tables.

AUTHOR VENTSEL', S.V. PA - 2167
TITLE On the Composition of Admixtures in Used Motor Oils. (Sostav mekhanicheskikh primesey v rabotavshikh motornykh maslakh).
PERIODICAL Izvestiia Akad.Nauk SSSR, Otdel.Tekhn., 1957, Nr 1, pp 153-156 (U.S.S.R.)
Received 3/1957 Reviewed 4/1957
ABSTRACT An X-ray structural analysis of floating particles which had been taken from already used motor oils was made. The particles were filtrated analytically and then processed chemically by means of pure piridium. This was done in order to increase the relative content of unorganic components and thus to obtain a maximum distinctness in the Debgegrams. The oil samples were taken from the oil sumps of tractor-motors.
Conclusions. 1) The basic unorganic component of the mechanic admixtures of used oils is α -iron. 2) The largest metal particles are covered with a visible layer of ferric oxide of a thickness of 460 ± 720 Å.
3) There are several reasons for assuming that these layers mainly consist of γ -oxydes of iron. (1 table and 2 illustrations)

✓ Structure and lubricating action of used motor oils.
S. V. Ventsel. Kolloid. Zhur. 15, 331-3 (1953).—The ultraviolet light absorption of used and then filtered motor oils is identical with that of fresh oils. The filter residue of used oils was sepd. into org. (a) and inorg. (b) parts. The wear prevention (in a Diesel motor) of used oils was greater the greater the ratio a:b. At the same value of a:b, the wear prevention by a fresh oil was almost equal to that by used oils. The org. impurities render the inorg. particles innocuous. . . . J. J. Bikerman

Title : The contact effect as a factor in the oxidation of oil in internal combustion engines
Periodical : Izv. AN SSSR, Otd. Tekh. Nauk 7, 139-144, Jul 55
Abstract : Describes apparatus for analytical tests with machine oil Su (GOST 1707-42), aviation oil MS-14, and motor oil ASp-5 (additives according to GOST 5303-50). Concludes that the contact effect accelerates oxidation of motor oils and suggests that test results can be utilized for development of lubrication systems, improving methods of reclaiming used oils, and standardizing laboratory oxidation ratings for motor oils. One illustration; 1 graph; 3 tables. Seven references, all USSR.

3088. ✓ AGEING OF OIL AND ABRAZIVE WEAR OF INTERNAL COMBUSTION ENGINES
Ventsel, S.V. (Vestn. Mashin. (Inzh. Ind. Buil., Moscow), 1953, vol. 33, (5), 26-28; abstr. in Chem. Abstr., 1953, vol. 47, 10829, 10830). Samples of lubricating oil taken from various internal combustion engines (aviation, tractors, locomotives, stationary, etc.) were filtered and then subjected to extensive tests along with unfiltered and fresh oil samples. The properties of used oil before filtration differed greatly from those of fresh oil; however, the removal of mechanical impurities (by filtration) decreased those differences. Thus, the acid numbers of used oils increased by 53-230% and the saponification value by 210-155% compared to fresh oil. Filtration reduced the difference in the acid numbers to 23-40% and reduced the saponification values 2.5 times. The molecular weights before and after filtration did not change. Absorption spectra of fresh and filtered oils were very close, indicating that the change in chemical composition was insignificant. Filtration residues were dried and divided into 2 lots, one of which was analysed and the other placed for 7 days in strong hydrochloric acid at 35° after which they were filtered, washed, dried, and analysed. The difference in the analyses was very small. Microscopic analyses of used oils showed the amber background of oil interspersed with black particles of mechanical admixtures. The particles formed aggregates, their quantity depending on the length of service of an oil. The results are taken to show that the organic products of oil deterioration are adsorbed on metal particles derived from engine wear and are removed by filtration. It is suggested that accumulation of these carbon compounds in the oil even improves to some extent the lubricating qualities of an oil. While oil should be changed periodically, primarily to prevent clogging of passage by solid particles, it should not be changed too frequently. C.A.

Kol'Zhur, Vol 15, No 5, pp 331-333

On the basis of the results described, indicates
that the mechanical admixtures in used lubricating
oil have a multicomponent structure and that the
metal particles are covered with protective col-
loids. Suggests that the ratio of the quantity of
organic impurities to the quantity of inorganic im-
purities may serve as an index of the quality of
lubricating oil.

AUTHORS: Likhter, A. I., and Ventsel', V. A.

TITLE: Hall effect in cerium during a phase transition of the first kind

PERIODICAL: Fizika tverdogo tela, v. 4, no. 2, 1962, 485 - 489

TEXT: A study has been made of the phase transition accompanied by an abrupt change in volume of Ce at pressures of up to 10,000 atm and at room temperature by measuring both the Hall emf and the resistance. The apparatus used for the purpose was similar to that described by A. I. Likhter and T. S. D'yakonova (FTT, 1, 95, 1959). The Hall emf was measured with an Φ-12 (F-12) photoelectric amplifier. The Ce specimen (7.5×2×0.12 mm) contained 0.02% Fe, < 0.75% Nd + Pr, and < 0.001% Cd + Pb + Bi + Sn. X-ray analysis showed no hexagonal phase in the specimen. Pure gasoline was used for pressure transmission. A sudden drop of the Hall emf was found between 7600 and 8000 atm. With decreasing pressure the transition likewise occurred in the same pressure range. The transition point was not shifted by a 100-fold rise or drop of pressure. At atmospheric pressure, the Hall coefficient A_p was $(2.0 \pm 0.05) \cdot 10^{-4} \text{ cm}^3/\text{coulomb}$. As the

magnetic field was non-uniform, the ratio A_p/A_0 was used, where A_0 is the value obtained by F. K. Speeding et al. (Phys. Rev., 91, 1372, 1953). A constant value of 0.25 A_0 was reached at 10,000 atm. A discussion on the basis of data concerning the conductivity of rare-earth metals indicates that the Hall coefficient is changed by the transition of a 4f electron into 5d shell. A phase transition induced by pressure and at room temperature is more complete than one induced by cooling. L. F. Vereshchagin, Corresponding Member AS USSR, is thanked for a discussion. TITLE: Problem on contact of shallow cylindrical shells with plates

SOURCE: Prikladnaya mekhanika, v. 2, no. 10, 1966, 83-90

TOPIC TAGS: ~~cylindrical shell~~, shallow cylindric shell, plate stiffened shell, finned cylindric shell, cylindric shell structure, shell deformation, reinforced shell structure, contact stress

ABSTRACT: The deformation of shallow cylindrical shells stiffened along the generatrices on their outer surface by plates normal to the middle surface is investigated. The loading of the shell skin is considered as consisting of the given external loading of the shell and an additional loading due to the joints of the shell with plates. The displacements and moments in the shell along the line of contact are analyzed by using the equations of the V. Z. Vlasov engineering shell theory modified in accordance with the contact conditions. Using the conditions of the joint deformation of the shell-plate system, the displacements in the middle surface of the shell are expressed through the displacements along the contact edge of the plate, and the derivation and use of expressions for determining the reactive loading (the normal and longitudinal components of the plate resistance) are indicated, assuming that the reactive contact stresses are constant across the plate

Card 1/2

ACC NR: AP6035496

thickness. The method is illustrated by a sample analysis of a simply supported shallow cylindrical shell joined with a longitudinal plate. A uniform normal load is applied to the shell only. A discrete variational method combined with the Bubnov-Galerkin method is used in determining the displacements and bending moments in the plate-stiffened shell. The distribution of moments along the line of the plate-shell contact is given in diagrams and compared with the moments in a plain shell under identical conditions. Orig. art. has: 2 figures and 26 formulas.
